According to the CDC, those who are impacted by severe COVID-19 are more likely to be hospitalized, need intensive care, require a ventilator, or even die. It is important to know if you have one or more risk factors for severe COVID-19 and to be prepared to start treatment within days of getting COVID-19.

If you are 50 or over, have diabetes, cancer, mental health conditions, obesity, asthma, or a number of other health conditions, you are at greater risk of developing severe COVID-19.
